## Project 2: Brief Report

I made a Super Smash Bros. Melee tier list inspired by <https://tiermaker.com/>.

But this time I added a little bit more personality. I continued using Visual Studio Code to write my code. There was the HTML extension that allowed for live previewing of my webpage and that allowed for a smooth workflow and this time I also tested it using a browser to preview.

The Google Chrome Browser was used to test the page on a PC, Safari was used to test the page on mobile, and Microsoft edge was used to test the page on the Xbox one. On PC everything was fine within a certain aspect ratio, once it got to a bigger screen it made the page look small.

My time on this project was spent mostly on adding a gradient background, which are just multiple cuts with a top to bottom gradient. I also added a transparent background on top of the gradient and I think it came out nice. Project number two came out better than project number one.

Another aspect that took lots of my time away from me was figuring out how animations worked with images. First, I tried making the animations from images, but it would get placed in obnoxious positions, so I decided to go a little simpler and just moved my name from the top to the bottom, once. I learned a ton about CSS and bootstrap this project, I am looking forward to what is to come.
