Tic Tac Toe Project

I tried to make a nice-looking Tic Tac Toe game using HTML, CSS, JavaScript, and jQuery. I followed along with a YouTube video and changed up some colors, and I added a background. I tried to fix some problems with the original video which were, the ability to click a square on the tic tac toe board would be gone in certain areas. I could not figure it out. I assume it is that the X and the O are both in the center of each square and are invisible and made visible based on the turn and if the invisible symbol is clicked. This is still a problem because I could not figure out how to get the whole square to check for a click.

Another thing that was bothering me was the position of the text on a smaller screen. Everything else scaled correctly, but the text above the game would be stuck lower than it was supposed to be. Also, there was an issue with mouse hovering.

Other than those problems with the game, everything is fully functional. The game works like a charm and it looks aesthetically pleasing. The text is dynamic, and the game is not too affected with different resolutions.

I will improve my skills and make sure the projects to come, especially the final project, will come out amazing functionality wise and aesthetically. Right now, the goal was to get a taste of jQuery. I feel that I am in a gradient phase where I like to use gradients in all my projects.

Perhaps I should experiment with different types of backgrounds. I was interested in animations, so I might go all out on the next couple projects and make an animated background.
