<div align="center">Project 1: Brief Report</div>

I made a Super Smash Bros. Melee tier list inspired by https://tiermaker.com/ .

I used Visual Studio Code to write my code, some extensions needed to be installed before I started though. There was the HTML extension that allowed for live previewing of my webpage and that allowed for a smooth workflow.

The Google Chrome Browser was used to test the page on a PC, Safari was used to test the page on mobile, and Microsoft edge was used to test the page on the Xbox one. On PC everything was fine with the resolution the images and text, but on mobile the images were too big and would make the rest of the information on the screen smaller. I had to readjust the images so that they would be centered and the same size on any browser.

Color coding the webpage consumed most of the time that I spend coding the site. Each Tier had a specific color, but my preview of the page was in dark mode and the final output was in light mode, I had to test which colors would work nicely in both.

Overall, I learned a lot in this assignment and I'm excited for what is to come.
